Front cover photos

Top: *Baker* was the third nuclear test conducted by the United States at Bikini Atoll on July 24, 1946. *Baker* was detonated underwater using a Mark 3 device similar to "Fat Man" with a yield of 21 kilotons. Visible in the spout are ships subjected to the effects of the underwater detonation.

Bottom left: *Grable* was the 42nd nuclear test conducted by the United States at the Nevada National Security Site on May 25, 1953. *Grable* was an airburst detonation fired from a 280 millimeter gun using a Mark 9 projectile, with a yield of 15 kilotons.

Bottom right: An aerial view of snow-covered Yucca Flat on the Nevada National Security Site. Visible are numerous subsidence craters that sometimes form when a collapse of the cavity created by an underground nuclear detonation continues all the way to the surface (more than 50 percent of the time).

Introduction

This document lists chronologically and alphabetically by test name **all** nuclear detonations, regardless of nuclear yield (save those used in combat), conducted by the United States from July 1945 through September 1992.

Two nuclear weapons that the United States exploded over Japan ending World War II are not listed. These detonations were not “tests” in the sense that they were conducted to prove that the weapon would work as designed (as was the first test near Alamogordo, New Mexico, on July 16, 1945), or to advance nuclear weapon design, or to determine weapons effects, or to verify weapon safety, as were the more than 1,000 tests that have taken place since June 30, 1946.

The nuclear weapon (nicknamed “Little Boy”) dropped August 6, 1945, from a U.S. Army Air Forces B-29 bomber (the Enola Gay) and detonated over Hiroshima, Japan, had an energy-yield equivalent to that of 15,000 tons of TNT. The nuclear weapon (nicknamed “Fat Man” and similar to the “Trinity” device) exploded on August 9, 1945, over Nagasaki, Japan, had an energy-yield equivalent to that of 21,000 tons of TNT. Both detonations were intended to end World War II as quickly as possible.

Data on U.S. tests were obtained from, and verified by, the U.S. Department of Energy’s (DOE) three weapons laboratories—Los Alamos National Laboratory (LANL), Los Alamos, New Mexico; Lawrence Livermore National Laboratory (LLNL), Livermore, California; and Sandia National Laboratories (SNL), Albuquerque, New Mexico—and the Defense Threat Reduction Agency (DTRA). Additionally, data were obtained from public announcements issued by the Atomic Energy Commission (AEC) and its successors: the Energy Research and Development Administration (ERDA), and DOE, respectively.

Caveat

The information contained in this document was gleaned from multiple sources over time. Some of the data have been updated to reflect the most recent analyses conducted by the national weapons laboratories. When discrepancies were encountered, every attempt was made to use the most acceptable or verifiable information. In some instances, multiple spellings of test names were encountered, and the most commonly used name is included in this document (e.g., *Johnnie Boy* versus *Johnie Boy*). Once a “test” has been categorized as such, no attempt has been made to change its categorization based on the current definition of a “test” found in the 1990 Protocols to the 1974 Treaty on the Limitation of Underground Nuclear Weapons Tests (also known as the Threshold Test Ban Treaty) and the

1976 Treaty on Underground Nuclear Explosions for Peaceful Purposes (also known as the Peaceful Nuclear Explosions Treaty). For example, *Huron Landing* and *Diamond Ace* were conducted simultaneously on September 23, 1982, and were announced as individual tests. Based on the current definition of a “test,” they would be considered as “one test with two simultaneous detonations.”

Revision 16 Changes

Numerous changes have occurred since issuance of Revision 15 in December 2000, and a number of discrepancies were also discovered in the document. The Nevada Test Site was renamed the Nevada National Security Site (NNSS), and the Nellis Air Force Range is now the Nevada Test and Training Range (NTTR). Some reported parameters (e.g., latitude, longitude, and elevations) were found to be inaccurate, and there were requests to revise these elements. There was limited height of burst information in Revision 15 for the atmospheric nuclear tests, and this and other unclassified information was added. To make NV-209 an even more comprehensive reference document for U.S. nuclear tests, the following modifications were incorporated:

- Location coordinates were added to include all tests and were updated for accuracy.
- Height of burst or depth of burial were added for all detonations. (Height and depth values are from surface elevation to the working point of detonations.)
- Text paragraphs in the Introduction were expanded to cover additional related subjects (e.g., Plowshare tests in the *Treaties* section).
- Explanations for how some new or revised values were determined have been included.
- Inconsistencies (e.g., hole number designations, sponsor) and editorial errors were corrected.
- Figures and tables were revised for both comprehensiveness and editorial enhancements.
- A test reference column was added to the Detonations - By Name alphabetical listing (back section) to correlate between the Tests - By Date sequential tests/detonations listing (front section).
- Some test numbers were reordered to reflect the correct sequence of U.S. detonations.
- A symbol (‐) was added to depict underground detonations that resulted in a surface subsidence crater.
- Definitions for specific topics were added.

- Radionuclide release information was clarified and made consistent with the primary reference document on the subject (DOE, Nevada Operations Office [DOE/NV] publication *Radiological Effluents Released from U.S. Continental Tests 1961 through 1992*, DOE/NV-317).
- Information that was declassified subsequent to Revision 15 was added where relevant.
- Interesting facts were added to specific detonations as notes in the front sequential list of tests/detonations.

Detonation Times and Dates

Detonation time and date for all detonations listed in this document were converted from local time to Greenwich Mean Time (GMT). The date listed is the GMT date for the detonation. Times are given in the hundredth of a second where available; otherwise, a default value of 0.00 seconds is used.

Locations

The first test of a nuclear weapon was in the atmosphere on July 16, 1945, in a remote part of New Mexico on what was then the Alamogordo Bombing Range, now the White Sands Missile Range. The site is 55 miles northwest of Alamogordo, New Mexico.

The word “site” is defined as “the land area withdrawn for U.S. government testing purposes (e.g., NNSS, NTTR, Project Shoal) or the area secured to ensure no inadvertent public intrusion (e.g., Amchitka Island and Rulison test vicinity).” Almost all nuclear tests were conducted within an area withdrawn from public domain; however, this is not true for the Amchitka and Rulison underground nuclear tests, where no formal land withdrawal was recorded.

At various times between June 1946 and November 1962, atmospheric and underwater tests were conducted by the United States in the Marshall Islands (Bikini and Enewetak Atolls), Christmas Island, Johnston Atoll in the Pacific Ocean, and over the South Atlantic Ocean.

Between January 1951 and July 1962, atmospheric and underground nuclear tests were conducted at the NNSS.

Since June 1963, all nuclear tests conducted in the United States have been underground, and most of them have been at the NNSS. Some tests were conducted on the NTTR; in central and northwestern Nevada; in Colorado, New Mexico, and Mississippi; and on Amchitka, one of the Aleutian Islands off the Alaska coast.

Latitude and longitude locations are the surface ground zero location of the drill hole or other emplacement

location. Historical continental U.S. detonation coordinates were surveyed in the respective State Plane Coordinate systems using North American Datum 1927 and are precise to within 1 foot (ft). The coordinates were mathematically converted to the World Geodetic System 1984 reference model to be more consistent with modern surveying standards involving Global Positioning Systems (GPS). However, these conversions have known limitations; see <http://www.ngs.noaa.gov/TOOLS/Nadcon/Nadcon.shtml>.

All coordinates are presented in decimal degrees to six decimal places, indicating accuracies of better than 1 ft. Accuracy validation was not conducted on each individual detonation coordinate.

The following assumptions were made regarding horizontal GPS coordinates:

- Underground (tunnel and borehole) detonations on the NNSS are assumed to be accurate to 1–2 ft.
- Stationary (towers and surface platforms) atmospheric detonations on the NNSS and at other locations within the United States were assumed to be accurate to within 5 ft.
- Atmospheric detonations conducted from dynamic platforms within the United States (e.g., dropped from airplanes, suspended from balloons) are assumed to be accurate to within 10 ft.
- Detonations conducted at low elevations in the Pacific are assumed to be accurate to within 100 ft.

The following assumptions were made regarding surface elevation data (above sea level):

- Atmospheric detonations conducted on static platforms are assumed to be accurate to within 5 ft.
- Underground detonations are assumed to be accurate to within 1 ft.
- Barge and underwater detonations are assumed to be accurate to within 5 ft.
- Detonations conducted above or below the ocean surface were assigned a surface elevation of zero (0).

The following assumptions were made regarding height of burst, depth of burial, or depth underwater:

- Underground, underwater, and stationary atmospheric detonations are assumed to be accurate to within 5 ft.
- The distinction between surface and tower tests was set at 10 ft above the ground surface (see *Glossary*).
- For atmospheric tests conducted on dynamic platforms, the height of burst (when given) is assumed to be accurate to within 100 ft.

Moratorium

On October 31, 1958, the United States entered into a unilateral testing moratorium announced by President Dwight D. Eisenhower with the understanding that the Soviet Union also would refrain from conducting tests. The Soviet Union resumed testing in September 1961 with a series of the largest number of tests ever conducted.

On September 15, 1961, the United States resumed testing at the NNSS on a year-round basis.

On October 2, 1992, the United States entered into another unilateral moratorium on nuclear weapons testing announced by President George H.W. Bush. President Bill Clinton extended this moratorium in July 1993, and again in March 1994 until September 1995.

On August 11, 1995, President Clinton announced the decision to negotiate a comprehensive nuclear test ban treaty while continuing the cessation of nuclear testing by the United States.

On September 24, 1996, President Clinton signed the Comprehensive Nuclear Test Ban Treaty, which prohibits "any nuclear weapons test explosion" by any State Party. This treaty has not been ratified by Congress and is therefore not legally binding. (See *Treaties*.)

Purposes of U.S. Tests

Past tests have been described as being for one of six purposes: *Joint US-UK*, *Plowshare*, *Safety Experiment*, *Vela Uniform*, *Weapons Effects*, and *Weapons Related*. Revision 15 contained an additional purpose: *Storage-Transportation*. However, this was removed, as these tests were also *Joint US-UK*.

With the declassification of all previous simultaneous detonations, purpose is now attributed to each detonation. Weapons-related tests were conducted to gather data on nuclear devices; weapons-effects tests were conducted, usually by the U.S. Department of Defense (DoD), to determine the effects of nuclear detonations on military offensive and defensive systems; and tests conducted for the United Kingdom (UK) are shown as "Joint US-UK." Individual tests/detonations could have different or multiple purposes. The purpose listed is considered the primary.

Radiological Effluents Released from Nuclear Detonations

Unless otherwise noted, all nuclear tests at the NNSS or NTTR before September 15, 1961, produced radioactivity detected offsite. (See *Glossary* for definition of "offsite.") All tests before this date precede the testing moratorium that began October 31, 1958.

Unless otherwise noted, no test at the NNSS or NTTR on or after September 15, 1961, had a release of radioactivity that was detected offsite. The release of radioactivity from a test can occur

- accidentally as a result of a containment failure,
- accidentally or deliberately as a result of post-test operations (e.g., drillback, gas sampling, cementback), or
- deliberately as a result of post-test controlled purging of gases generally from a tunnel.

All releases resulting from a containment failure, even if not detected offsite, are reported. Radiation releases resulting from tunnel purging or normal operations are reported in this document regardless whether they were detected offsite or onsite only. These releases are listed in the DOE/NV publication *Radiological Effluents Released from U.S. Continental Tests 1961 through 1992*, DOE/NV-317.

Seismic Source Data

Detonation times and locations (latitude, longitude, and surface elevation) are included and are intended for use in the calibration of seismic stations that are part of the International Monitoring System called for in the 1996 Comprehensive Nuclear Test Ban Treaty.

Detonation time and location of past underground nuclear detonations are ideal quantities for calibrating a seismic network for accurate location of a new source. This ground truth information can be used, for example, to refine seismic velocity models and to determine station corrections for parts of North America.

Those detonations that could be especially valuable for International Monitoring System calibration are identified with **boldface** type. Included in this subgroup are 8 detonations that took place somewhere other than the NNSS and 14 that occurred at the NNSS. These 14 were selected because they

- occurred within the last 5 years of testing, therefore increasing the chance that the detonations were recorded on modern seismograph systems;
- are well distributed about the NNSS to include at least two from each of the major test regions (e.g., Pahute Mesa, Rainier Mesa, and Yucca Flat);
- are relatively large, allowing recording on multiple instruments; or
- were the subject of special study.

The seismic source data for underground nuclear detonations was gathered from all available official sources, including reports by DOE, its predecessors and contractors, and the Defense Nuclear Agency (DNA). All

reasonable effort has been expended to ensure the greatest possible accuracy of this seismic data.

Time calibrations are obtained from the National Institute of Standards and Technology WWV radio stations. Tests were typically planned to be detonated on the exact hour, minute, or second. However, the firing systems always introduce some delay so that the actual detonation time could be as much as 150 milliseconds later than intended. When information on this delay is available, detonation times are given to the nearest 0.01 second, uncorrected for WWV propagation; otherwise, a default value of 0.00 is given.

Series

Each series of tests is given a name, such as *Operation Crossroads*. U.S. nuclear tests were conducted on an intermittent basis from June 1946 to October 1958.

On September 15, 1961, when the United States resumed testing at the NNSS on a year-round basis with Operation Nougat, tests were grouped for fiscal and reporting purposes according to the fiscal year in which they took place. For example, fiscal year 1963 tests—which began July 1, 1962, and extended through June 30, 1963—were in the Operation Storax series.

Between April and November 1962, the United States conducted Operation Dominic, which included the DoD Operation Fishbowl high-altitude tests in the Pacific. The DoD also conducted four weapons-effects tests at the NNSS in July 1962 as Operation Sunbeam.

In 1976, the federal government changed the fiscal year to begin on October 1 and end on September 30. Accordingly, the fiscal year 1976 series (Operation Anvil) did not end on June 30 but was extended through September 30, 1976—a period of 15 months.

Treaties

On August 5, 1963, the United States and the Soviet Union signed the Limited Test Ban Treaty, which effectively banned testing of nuclear weapons in the atmosphere, oceans, and space. This treaty entered into force on October 10, 1963.

On July 1, 1968, the United States, the Soviet Union, and 60 other countries signed the Treaty on the Non-Proliferation of Nuclear Weapons (also known as the Nuclear Nonproliferation Treaty). This treaty entered into force on March 5, 1970, and represents the only binding commitment in a multilateral treaty to the goal of disarmament by the nuclear-weapon states.

On July 3, 1974, the United States and the Soviet Union signed the Threshold Test Ban Treaty, restricting all

underground nuclear test explosions to yields no greater than 150 kilotons (kt). On May 28, 1976, the nations also signed the Peaceful Nuclear Explosions Treaty, which stemmed from Article III of the Threshold Test Ban Treaty and restricts individual peaceful nuclear explosions to yields no greater than 150 kt. These treaties entered into force on December 11, 1990.

Discussion on peaceful uses for nuclear explosions began in the mid-1950s and culminated in a formal Plowshare Program under the Division of Military Application in June 1957. This program was publicly announced on June 6, 1958. No Plowshare nuclear detonations took place until December 10, 1961, (*Gnome*) due to a moratorium on nuclear testing; however, many plans and experiments using non-nuclear detonations were conducted during the period. From late 1961 through mid-1973, the United States conducted 27 Plowshare nuclear tests, including 36 individual nuclear device detonations. Additionally, there were several more tests listed as “weapons related” that were also related to Plowshare explosives. The Plowshare Program was discontinued at the end of 1975 due to economic and environmental concerns,

The Joint Verification Experiment was conducted in 1988 by the United States and the Soviet Union as a prelude to the signing of the 1990 Protocols to the Threshold Test Ban Treaty and the Peaceful Nuclear Explosion Treaty. Proposed treaty verification techniques and measurements were employed on the *Kearsarge* test conducted by the United States on August 17, 1988, at the NNSS; and on the *Shagan* test conducted by the Soviet Union on September 14, 1988, at the Semipalatinsk Test Site.

In May 1995, the United Nations reached consensus and indefinitely extended the Nuclear Nonproliferation Treaty. This action was a priority for the U.S. arms control agenda and critical to proceeding with a test ban treaty. On August 11, 1995, President Clinton announced the decision to negotiate a comprehensive nuclear test ban treaty while continuing the cessation of nuclear testing by the United States.

Even though President Clinton signed the Comprehensive Nuclear Test Ban Treaty on September 24, 1996, DOE has been directed to maintain an underground test readiness program in case it is in the “supreme national interest” to resume nuclear weapons testing.

Types and Purposes

The definition of terms used in this document appears in the *Glossary*. *Type* refers to the method of deployment of the nuclear device at time of detonation, such as *tower*, *tunnel*, or *airdrop*.

Purpose indicates whether the test was part of the weapons development program, a DoD effects test, a Joint US-UK test, or was part of some special program that involved the use of nuclear devices. In the *Summary*, the sum of all tests conducted underground (*tunnel*, *shaft*, and *crater*) appears as *Total Underground*. With the exception of five underwater tests, the remaining tests appear as *Total Atmospheric*.

Yields

The nomenclature for test yields varied according to information policy governing specific years. In some cases, no yield information has been released; in a few cases, the terms "very slight" and "slight" were used without amplification. For completeness, even underground nuclear detonations with little or no nuclear yield have been included. Except for tests where specific yields or relative specific yields such as "about 2 kt," "several Mt," or "less than 0.1 kt" were announced, test yields are given in these terms:

1945 through 1963

- Low (less than 20 kt)
- Intermediate (20 to 200 kt)
- Submegaton (less than 1 Mt, but more than 200 kt)
- Low Megaton (from 1 to several Mt)
- Megaton Range

1964 through February 1976

- Less than 20 kt
- 20 to 200 kt
- 200 to 1,000 kt

March 1976

During a series of high-yield tests conducted during this month, two ranges were added, and the 200 to 1,000 kt range was dropped.

- 200 to 500 kt
- 500 to 1,000 kt

Since March 1976

On March 31, 1976, the United States and the Soviet Union agreed to limit the maximum yield of underground tests to 150 kt.

- Less than 20 kt
- Less than 150 kt
- 20 to 150 kt

Joint Verification Experiment

Data exchanges provided for in the Protocol to the 1974 Threshold Test Ban Treaty required the exchange of historic explosion data on five detonations with yields within the 100 to 150 kt range. Under the Joint Verification Experiment of 1988, this yield range was added. However, this yield range now applies only to *Kearsarge*; the other detonations now have specified yields.

- 100 to 150 kt

Notes on Research

When using NV-209 as a research tool, there are a few hints and tricks that can develop better results. When researching a particular test, using names of locations and institutions at the date of the test often results in more and better data. The reason for this is that many archives and library databases have not been updated with current affiliations. For example, searching for "LASL" instead of "LANL" will often give different results in computer searches.

Some key dates and institutions that are particularly important for use with NV-209 are as follows:

Test Areas

- Site Mercury
1950–1951
- Nevada Test Site (NTS)
1951–1952
- Nevada Proving Ground
1952–1954
- NTS
1955–2010
- Nevada National Security Site (NNSS)
2010–present

Federal Agencies

- Atomic Energy Commission (AEC)
1946–1974
- Energy Research and Development Administration (ERDA) 1974–1977
- U.S. Department of Energy (DOE)
1977–2001
- DOE/National Nuclear Security Administration (NNSA) 2001–present

Laboratories

- Los Alamos (Manhattan Engineering District)
1943–1947
- Los Alamos Scientific Laboratory (LASL)
1947–1980
- Los Alamos National Laboratory (LANL)
1980–present
- University of California Radiation Laboratory (RL)
1952–1958
- Lawrence Radiation Laboratory (LRL)
1958–1971
- Lawrence Livermore Laboratory (LLL)
1971–1980
- Lawrence Livermore National Laboratory (LLNL)
1980–present

DTRA is another agency that is not specifically cited in NV-209 but is very relevant to nuclear testing. It, too, has had numerous name changes over the years, and associating the date of the test with the correct agency name will often give better research results.

- Armed Forces Special Weapons Project (AFSWP)
1947–1959
- Defense Atomic Support Agency (DASA)
1959–1971
- Defense Nuclear Agency (DNA)
1971–1996
- Defense Special Weapons Agency (DSWA)
1996–1998
- Defense Threat Reduction Agency (DTRA)
1998–present

One last hint to aid in research: Although the tests are listed by GMT, using local time will often assist in identifying details in associated photographs. Before 1966, time information is even more confusing, as there was no standard on the use of Daylight Saving Time. Many of the early tests were conducted at sunrise; thus, an hour or two difference can make a substantial difference in ambient lighting when trying to identify unknown photographs.

Table 4 - U.S. Nuclear Tests/Detonations — Total — By Location

A **test** is defined in the Threshold Test Ban Treaty as either a *single underground nuclear explosion* (detonation) conducted at a test site, or *two or more underground nuclear explosions* (detonations) conducted within an area delineated by a circle having a diameter of 2 kilometers (1.24 miles) and conducted within a total period of time not to exceed 0.1 second. Sixty-three of the 1,054 nuclear tests conducted by the United States consisted of more than one underground nuclear explosion (detonation).

Nevada National Security Site - 62 tests had simultaneous detonations
 Rifle, Colorado - 1 test had a simultaneous detonation

Purpose	Detonations
Joint US-UK	28*
Plowshare	36
Safety Experiment	88
Vela Uniform	7
Weapons Effects	100
Weapons Related	890
TOTAL DETONATIONS	1,149

* Four of the Joint US-UK tests were storage-transportation tests conducted on the Nevada Test and Training Range.

Priscilla was a test conducted on June 24, 1957, at the NNSS. It was a balloon, weapons related test that produced a yield of 37 kt.

Barnwell was a test conducted on December 8, 1989, underground at Pahute Mesa on the NNSS. *Barnwell* was a Joint US-UK test with a yield of 20 to 150 kt. Shown at right is the diagnostic rack ready for lowering down the emplacement hole.

Diamond Sculls was a test conducted on July 20, 1972, in a tunnel at Rainier Mesa on the NNSS. *Diamond Sculls* was a weapons effects test where the radiation from the detonation traveled 2,000 ft down a tapered horizontal line-of-sight pipe to the test chambers (shown above), which were 27 ft in diameter. Fast-closure doors in the pipe stopped flying debris after the radiation went by and protected the experiments from debris-impact damage.

Cannikin was a test conducted on November 6, 1971, at Amchitka Island, Alaska, one of the westernmost islands on the Aleutian Islands chain. *Cannikin* was a weapons related test of the W71 Spartan missile warhead. With a yield of less than 5 Mt, *Cannikin* is the largest underground detonation conducted by the United States and is important from a seismic data perspective.

Handley was conducted on March 26, 1970, in hole U20m in the northwestern part of the NNSS. The test yield was more than 1 Mt, one of the largest detonations conducted at the NNSS. The downhole emplacement of the *Handley* device and diagnostics rack is shown above.

Sedan crater was formed when a 104-kt explosion buried under 635 ft of desert alluvium was fired at the NNSS on July 6, 1962, displacing 12 million tons of earth. The crater is 320 ft deep and 1,280 ft in diameter.

Project 56 No. 4 was a test conducted on January 18, 1956, in Area 11 on the NNSS. *Project 56 No. 4* was a safety experiment with a yield of 1 ton. Part of the experiment included acquiring data about plutonium dispersal under conditions related to detonations where there could be little to no yield.

**Table 6 - U.S. Nuclear Tests/Detonations Conducted
on the Nevada National Security Site — By Area**

Area on the NNSS	Number of Tests	Number of Detonations

UK	United Kingdom
US/U.S.	United States

Glossary

Airburst	A type of atmospheric test in which the explosion of a nuclear weapon occurred at such a height that the expanding fireball did not touch the earth's surface before the fireball reached its maximum luminosity. The airburst reported in this document (<i>Grable</i> , test #42) resulted from the detonation of an MK9 device fired from a 280mm gun.
Airdrop	A type of atmospheric test in which a nuclear device was dropped from an aircraft and exploded in the atmosphere.
Atmospheric	A test conducted above ground or above water (i.e., in the open air).
Balloon	A type of atmospheric test in which a nuclear device was suspended from a balloon and exploded in the atmosphere.
Barge	A type of atmospheric test in which a nuclear device exploded on a barge moored in the lagoon at Enewetak Atoll or Bikini Atoll.
Cementback	Operation whereby the drill hole was sealed with a plug and cemented to the surface.
Controlled release	A planned, filtered release frequently performed to reduce airborne radiation levels in the working environment.
Crater	A type of underground test in which a surface depression was formed by the detonation of a nuclear device placed shallow enough underground to produce a throw-out of earth when exploded. (Also see <i>subsidence crater</i> .)
Detonation	A single nuclear device explosion; one or more comprised a test.
Drillback	Directional drilling operation, performed after test activities were ceased, to sample fission product materials in the test cavity. While nearly all later tests had directional drilling, some early tests had vertical sample drilling from the crater floor.
Gas sampling	Operation, usually performed after test activities were ceased, to determine levels of noble gases present. Some prompt gas-sampling activities were conducted very soon after the detonation (mostly LLNL sampling).
Hole	The location of a nuclear weapon test/detonation conducted at the NNSS. The uppercase alpha designator refers to the type of location (i.e., S = surface, U = underground). The numeric designator refers to the geographical area of the NNSS. The remaining letters generally were sequential but could also represent subareas (e.g., U10ca, U10cb). In the case of most atmospheric tests, only the geographical area of the NNSS is given.
Joint US-UK	A nuclear test conducted jointly by the United States and the United Kingdom under a cooperative agreement that has remained in effect between the two countries since August 4, 1958.

Kiloton	The energy of a nuclear explosion that is equivalent to the explosive power of 1,000 tons of TNT.
Megaton	The energy of a nuclear explosion that is equivalent to the explosive power of 1 million tons of TNT.
Mudpit release	A breach of a pit used to contain radioactively contaminated mud generated from post-shot drillback operations.
Nellis Air Force Range	Former name of the Nevada Test and Training Range.
Nevada National Security Site	An area of land established as the Atomic Energy Commission's on-continent proving ground in 1950. The NNSS is located 65 miles northwest of Las Vegas in Nye County and covers an area of approximately 1,360 square miles.
Nevada Test and Training Range	An area of land that surrounds the east, north, and most of the west boundary of the NNSS. The NTTR is controlled by the U.S. Air Force and covers more than 4,500 square miles.
Nevada Test Site	Former name of the Nevada National Security Site.
Offsite	Any place outside the Test Range Complex or an area withdrawn/secured for a nuclear test within the continental boundaries of the United States.
Onsite	A notation that <i>radioactivity was detected onsite only</i> is made for any test from which there was a release of radioactivity into the atmosphere that was not detectable beyond the boundaries of the Test Range Complex or Offsite location.
Plowshare	A test in the Plowshare Program intended to explore the application of nuclear explosives to peaceful uses. Potential uses included excavating (various applications), producing isotopes, and fracturing tight geologic formations (enhanced oil and gas extraction).
Retarc	<i>Sulky</i> , test #396, was intended to form a throw-out crater, but at the depth of burial used, the stronger-than-expected rock medium confined the explosive energy of the detonation so that only a mound of broken rock was formed. This was dubbed a "retarc" ("crater" spelled backward).
Rocket	A type of atmospheric test in which a nuclear device was launched by rocket and exploded in the atmosphere.
Roman Candle	A test conducted underground in an unstemmed hole to minimize, but not eliminate, the release of radioactivity to the atmosphere. Because radiation-induced fluorescence was seen as a beam of light, this was sometimes referred to as a "Roman candle" effect.
Safety Experiment	An experiment designed to confirm that a nuclear explosion would not occur in case of an accidental detonation of the chemical explosive associated with the device.

Seismic Calibration	A test conducted to evaluate seismic effects of an underground explosion.
Shaft	A type of underground test in which a nuclear device exploded at the bottom of a drilled or mined vertical hole. Some safety tests were set off at the bottom of unstemmed drilled holes.
Simultaneous	Two or more underground nuclear explosions (detonations) conducted within an area delineated by a circle having a diameter of 2 kilometers (1.24 miles) and conducted within a total period of time that did not exceed 0.1 second.
Site	The land area withdrawn for U.S. government testing purposes (e.g., NNSS, NTTR, Project Shoal) or the area secured to ensure no inadvertent public intrusion (e.g., Amchitka Island and Rulison test vicinity). Almost all nuclear tests were conducted within an area withdrawn from public domain; however, this was not true for Amchitka and Rulison underground nuclear tests, where no formal land withdrawal was recorded.
Sponsor	The organization(s) (i.e., national weapons laboratory or laboratories, the U.S. Department of Defense, and/or the United Kingdom) responsible for conducting a particular nuclear test/detonation.
Storage-Transportation	Detonations of combinations of high explosives and nuclear materials designed to study distribution of nuclear materials following accidents in several transportation and storage configurations. There was no nuclear yield.
Subsidence crater	A depression that may form at the ground surface following an underground detonation. At the end of the dynamic phase of cavity growth, a pressurized standing cavity is present. As the cavity pressure and temperature decrease, the roof of the cavity becomes unstable and falls into the cavity. The top of the so-called "chimney," now formed above the cavity, continues to fall into the void. A phenomenon known as "bulking" results in the fallen material having decreased density from its normal state, hence increased volume. If the bulking fills the chimney, collapse stops without reaching the surface. Such a subsurface collapse can also be caused by the chimney's intercepting a high-strength geologic structure. When the chimney reached the surface, a subsidence crater was formed. The size of the subsidence crater depends on the yield of the device, the depth of emplacement, and the geological characteristics of the surrounding soil.
	A throw-out crater (see <i>crater</i>) is formed by a totally different mechanism than a subsidence crater.
Surface	A type of atmospheric test in which a nuclear device was placed on or close to the earth's surface, but no more than 10 ft off the ground.
Surface elevation	The vertical distance from mean sea level to a point on the earth's surface; generally refers to the surface ground zero of a nuclear device test/detonation.
Test	Defined in the Threshold Test Ban Treaty as either a single underground nuclear explosion conducted at a test site, or two or more underground nuclear explosions conducted within an area delineated by a circle having a diameter of 2 kilometers and conducted within a total period of time that did not exceed 0.1 second.

Test Range Complex	An area that includes both the NNSS and the adjacent U.S. Air Force-controlled NTTR.
Thermonuclear device	Commonly referred to as a “hydrogen bomb,” part of the explosion energy from this device resulted from the fusion of light nuclei such as those of hydrogen isotopes.
Ton	The energy of a nuclear explosion that is equivalent to the explosive power of 1 ton of TNT. (The yield of a nuclear device is a measure of the amount of energy released when it explodes. It is stated in terms of the quantity of TNT that would produce the same amount of explosive energy.) By definition, 1 ton is equivalent to 10^9 (E9) calories.
Tower	A type of atmospheric test in which a nuclear device was mounted near the top of a steel or wooden tower and exploded in the atmosphere 10 ft or more above the ground.
Tunnel	A type of underground test in which a nuclear device exploded within a horizontal drift mined into a mountain or mesa in a way that placed the burst point deep within the earth.
Underground	A test in which a nuclear device exploded in a tunnel, or near the bottom of a drilled or mined hole or shaft. Some underground nuclear tests were not designed to contain all radioactivity (e.g., cratering tests or safety experiments).
Underwater	A test in which a nuclear device was detonated underwater.
Vela Uniform	A U.S. Department of Defense program designed to improve the capability to detect, identify, and locate underground nuclear explosions.
Verification Experiment	A test on which the former Soviet Union exercised its right to verify under the terms of the Threshold Test Ban Treaty.
Weapons Effects	A type of atmospheric test conducted to evaluate the civil or military effects of a nuclear detonation on various targets, such as military hardware.
Weapons Related	A type of atmospheric test conducted for the purpose of testing a nuclear device intended for a specific type of weapon system.
Yield	The total effective energy released in a nuclear explosion. It is usually expressed in terms of equivalent tonnage of TNT required to produce the same energy release in an explosion.

Index of Nuclear Test Series

Operation Anvil	86
Operation Aqueduct	110
Operation Arbor	82
Operation Argus	12
Operation Bedrock	84
Operation Bowline	62
Operation Buster	2
Operation Castle	4
Operation Charioteer	104
Operation Cornerstone	108
Operation Cresset	90
Operation Crossroads	2
Operation Crosstie	56
Operation Dominic	20
Operation Emery	74
Operation Fishbowl	26
Operation Flintlock	46
Operation Fulcrum	88
Operation Fusileer	100
Operation Greenhouse	2
Operation Grenadier	102
Operation Grommet	76
Operation Guardian	94
Operation Hardtack I	10
Operation Hardtack II	12
Operation Ivy	4
Operation Jangle	2
Operation Julin	112
Operation Latchkey	52
Operation Mandrel	66
Operation Musketeer	106
Operation Newsreel	10
Operation Niblick	34
Operation Nougat	16
Operation Phalanx	98
Operation Plumbbob	8
Operation Praetorian	96

Operation Project 56.....	6
Operation Project 58.....	10
Operation Project 58A	10
Operation Quicksilver.....	92
Operation Ranger.....	2
Operation Redwing.....	6
Operation Roller Coaster	32
Operation Sandstone	2
Operation Sculpin.....	110
Operation Storax.....	26
Operation Sunbeam.....	26
Operation Teapot	4
Operation Tinderbox.....	94
Operation Toggle	78
Operation Touchstone	106
Operation Tumbler-Snapper.....	2
Operation Upshot-Knothole	4
Operation Whetstone	40
Operation Wigwam.....	6
